

Internal Audit Report 2025 (Restricted)

Scope

This restricted audit reviewed access management, change control and data retention across the engineering and finance functions for the period January to May 2025.

Key Findings

Finding A (Medium): 4 of 60 sampled user accounts retained access to systems no longer required by their role, indicating gaps in the quarterly access review. Finding B (Low): two production changes in March bypassed the standard peer-approval step during an incident.

Latest Findings Summary

The most recent audit findings highlight access-recertification gaps and incomplete change records during incidents as the two highest-priority items. No critical or high findings were identified.

Remediation

Management agreed to automate access recertification by Q3 2025 and to enforce break-glass change documentation within 24 hours of any emergency change.
