

Production Deployment Guide and Standards

Deployment Pipeline

All changes flow through CI: lint, unit tests, integration tests, and a security scan must pass before a build is promoted. Deployments to production require a green pipeline and one peer approval.

Release Strategy

Production uses blue-green deployments with automated smoke tests. If error rates exceed 2% within ten minutes of a release, the deployment is automatically rolled back to the previous version.

Change Windows

Standard deployments are permitted Monday to Thursday between 10:00 and 16:00. Friday and weekend deployments require an on-call lead approval to reduce incident risk.

Rollback

Every deployment must be reversible within five minutes. Database migrations must be backward compatible and applied separately from code that depends on them.
