

Internal Platform Documentation

Platform Overview

The Acme internal platform provides shared services for authentication, search, messaging and storage so that product teams can ship features without rebuilding infrastructure.

Authentication Service

Issues short-lived JWT access tokens (15 minutes) and refresh tokens (8 hours). Supports OIDC federation with the corporate identity provider.

Search Service

Provides hybrid keyword and vector search over indexed documents. Tenants are isolated by namespace and results are filtered by access policy before they are returned.

Storage Service

Object storage with server-side encryption, lifecycle policies and per-bucket access controls integrated with the central RBAC system.
